

15/08/2024 mentor meeting (week 4)_SC_platypus

Date Time

15/08/2024 1:15 pm - 1:50pm

Meeting Venue

[Zoom](#)

Attendees

Mentor

Afsana Imam

Team members

- Yi Xu
- Jingbo Lu
- Zhenhao Chen
- Xinying Qiao
- Lingrui Liang
- Ming Lu

Minute Takers

Lingrui Liang

Meeting Agenda:

- Q&A about Sprint 1
- Some guidance

Meeting Minutes:

1.Does the place showing pictures mean the Readme file? Do you want us to take one picture or several single pictures for each member?

It's your homepage. It's your so the picture you just have to take one group picture. Not a single or several pictures and that can be your README file for your team information and provide your roles and responsibility.

2. We are confused about what we should hand over at the end of Sprint 1. If we need to make multiple diagrams, do you want to see them desperately in GitHub or in one file like the 4+1 templates?

Four plus one document is just an example. It is not consistent with your Sprint 1 requirements. Basically, you need class diagram, user case diagram, your logical, physical and deployment view ,your database ,your system. These are the things you can include in your design concepts in your executable architecture. If you have database, you can add your database as well.

3.If we succeed to the RedBack's requirements and make no change, we just need to conclude it into a single file named "Baseline Requirement", and do nothing more?

If not, do we need to do things like acceptance tests, paper prototype and digital prototype from the checklist? How to make them?

You don't have to change their requirements. If you're changing or defining any design, you can just write the justification that this is the design you have refined or reused from the readback requirements. You don't have to write anything what red backs has written. If you think any of the features or any of the requirements artifacts needs to be update, or any of them needs to be refined,you need some justification and make it a file and put it on the github.

4.How to arrange our GitHub directory? Could you visit it and give us some suggestions?

You can see SC bluering markdown file.You can see how they added like how they added baseline tag, you can follow their documentation style like how they did the documentation.One thing is you have folders ready and write your project overview. And your team members who are your team members,their roles and responsibilities,you can insert team picture.And then below is your stakeholder, mentor.ChangeLogs can have links to your markdown files ,and basically your team structure team information would be here, and your team pictures.And then is your repository structure .

5. What does a runnable build mean? Does it mean an environment that has no features but contains all the component architectures?

You didn't have to code you don't have to implement anything. This sprint you have to just do your design concepts.It will be your whole design concept architecture, design concepts and risk management.

6. Is risk tracking and management needed? Does it need to start from Sprint 1?

You have to write some risk cases, for example, your non functional requirements should be security. You can generalize that is it a high risk, medium risk or lower risk,and you can update them.

7.Do we need to do anything on GitHub's WIKI interface?

Your assessment will be access from Github,your github is the main documentation. If you want, you can use that as well assigned the task to your team.

8.Where should we place the ChangeLogs on GitHub?

In readme.

9. What's about the justification.

For your authentication service you have created, what's the function of it and its purpose.

- You can have any validation for login requirement, For example, two way, authentication or security, because you have to describe this in your non functional requirement as security. So validation as in like it will ask for a format of a password, or it will ask for a security questions, or probably two fa like two factor authentication.
- You can add sequence diagram, use diagram, class diagram and explain them.
- For user diagram, try to use the correct notations and just one or two line to explain.
- For reuse plan, you need to have a justification, three to four lines, about you have done, the deal of framework, your usable approach.
- About server, you can use local server and Amazon cloud platform, which you can use your student email address for registering it and for your student email address, it will give you three months free trial. If you are running like a website, you can give us the instruction .
